(a) Serial loop, N = 6 papers: total time vs. model latency L (τ = 2 s)
Total time for 6 papers (s)
Injected model latency, L (s)
measured (one run per point)
model 5·max(L, τ) + L
(b) HTTP 429 handling: time until success / failure
Elapsed (s)
Consecutive 429 responses before the first 200
4th 429 → error thrown
measured, request succeeded (n = 3 per k)
measured, error thrown
model Σ(2^a + 0.25)
